A set of equations for the calculation of plasma rotation and the radial electric field in the edge plasma is presented. The equations are based on particle and momentum balance and explicitly incorporate neoclassical viscosity and atomic physics effects, and allow for the inclusion of anomalous effects.

1 Introduction

The toroidal and poloidal rotation and related radial electric field observed in the edge (and core) of tokamak plasmas are of interest for several reasons, not least of which is what they reveal about radial momentum transport, but also because of their apparent role in the L-H transition and the edge pedestal. It was recently shown [1] that if the heat transport coefficients and rotation velocities are taken from experiment, then the particle, momentum and energy balance equations and the conductive heat conduction relation are sufficient to determine the observed edge pedestal profile structure in the density and temperature profiles in several DIII-D discharges. Thus, it would seem that understanding the edge pedestal structure is a matter of understanding the edge rotation profiles. We present a practical computational model for the rotation and the radial electric field profiles in the plasma edge that is based on momentum and particle balance, includes both convective (including anomalous) and neoclassical gyroviscous momentum transport, and incorporates atomic physics effects associated with recycling neutrals.

2 Radial Electric Field

An expression for the radial electric field can be derived from the radial component of the momentum balance equation for ion species \( j \)

\[
\frac{n_j m_j}{e_j} \left\{ \left[ (V_j \cdot \nabla) V_j \right]_r + \left[ \nabla \cdot \Pi_j \right]_r + \frac{\partial p_j}{\partial r} \right\} = n_j e_j \left( E_r + V_{\theta j} B_\phi - V_{\phi j} B_\theta \right) + F_{rj} + M_{rj} - m_j \left( n_j \nu_{at,j} + \tilde{S}_j \right) V_{rj}
\]

where \( M_{\xi j} \) is the \( \xi \)-component of the momentum input, \( \tilde{S}_j \equiv S_j - \langle S_j \rangle \) is the poloidally varying part of the ionization source (due to recycling and fueling neutral influx and neutral beam injection), \( F_j \) is the friction force and \( \nu_{at,j} = \nu_{ion,j} + \nu_{cx,j} + \nu_{el,j} \) represents atomic physics processes – ionization, charge exchange, elastic scattering.

The radial component of Eq. (1) yields

\[
E_r = -\frac{n_j e_j}{m_j} \frac{\partial p_j}{\partial r} + V_{\phi j} B_\theta - V_{\theta j} B_\phi - m_j \left( \frac{\cos \theta V_{\phi j}^2}{R} + \frac{V_{\theta j}^2}{r} \right)
\]

where the unfamiliar last term results from retention of inertial effects to leading order.

3 Poloidal rotation and density asymmetries

Equations for the poloidal rotation velocities and for the poloidal density asymmetries can be derived from the poloidal components of the momentum balance equations and the particle balance equations for ion species “j”

\[ n_j m_j \left( [V_j \cdot \nabla] V_j \right)_\theta + [\nabla \cdot \Pi_j]_\theta + \frac{1}{r} \frac{\partial (\rho q_j)}{\partial \theta} - M_{\theta j} - F_{\theta j} + n_j \varepsilon_j \left( V_{rj} B_\phi - E_\theta \right) + m_j \left( n_j \nu_{\text{elcx}} + S_j \right) = 0 \]  

(3)

where the poloidal components of the inertial and viscous terms are

\[ n_j m_j \left( [V_j \cdot \nabla] V_j \right)_\theta = n_j m_j \left[ V_{rj} \frac{\partial V_{\theta j}}{\partial r} + \frac{V_{rj} V_{\theta j}}{r} + \frac{1}{r} \frac{\partial V_{\theta j}^2}{\partial \theta} + \frac{V_{\phi j}^2}{R} \sin \theta \right] \]  

(4)

and

\[ [\nabla \cdot \Pi_j]_\theta = \eta_{\theta j} \left( \frac{1}{2} A_{\alpha j} \right) \left( \frac{1}{r} \frac{\partial \ln (n_{\theta j} A_{\alpha j})}{\partial \theta} - 3 \frac{\sin \theta}{R} \right) \]  

(5)

with

\[ A_{\alpha} = 2 \left\{ -\frac{1}{3} \left( \frac{\partial V_p}{\partial l} \right)_p + \left[ \left( \frac{1}{R} \right) \frac{\partial R}{\partial l_p} + \frac{1}{3} \left( \frac{1}{B_p} \right) \frac{\partial B_p}{\partial l_p} \right] V_p + f_p R \frac{\partial (V_{\phi j} R)}{\partial l_p} \right\} \]  

(6)

and the neoclassical parallel viscosity coefficient can be represented by [2]

\[ \eta_{\theta j} = \frac{n_j m_j \nu_{\text{thj}} q R e^{-3/2} \nu_{\theta j}^*}{(1 + e^{-3/2} \nu_{\theta j}^*) (1 + \nu_{\theta j}^*)} \equiv n_j m_j \nu_{\text{thj}} q R f_j \left( \nu_{\theta j}^* \right) \]  

(7)

where \( \nu_{\theta j}^* \equiv \nu_{\theta j} q R / v_{\text{thj}} \), \( f_p = B_p / B_\phi \) and \( e = r/R \).

Making low-order Fourier expansions of the form \( n_j (r, \theta) = \tilde{n}_{j0} (r) + \tilde{n}_j^\phi \sin \theta + \tilde{n}_j^\theta \cos \theta \) and taking the flux surface average with weighting functions 1, \( \sin \theta \) and \( \cos \theta \) results in a coupled set of equations (three times the number of ion species) that can be solved for the \( V_{\theta j}^0 \) and \( \tilde{n}_j^\phi, \tilde{n}_j^\theta \equiv \tilde{n}_j^\phi / \varepsilon \tilde{n}_j^\theta \) for all the plasma ion species. Assuming \( V_{rj} \ll V_{\theta j} < V_{\phi j} \), the resulting equations are

\[ \tilde{V}_{\theta j} = -q \tilde{V}_{\phi j} \varepsilon \left( \tilde{n}_j^\phi + \tilde{\Phi}^\phi \right) - q^2 f_j f_p \left( 1 + \tilde{\Phi}^\phi + \tilde{n}_j^\phi \right) + f_p \sum_{k \neq j} \nu_{jk}^* + \hat{\nu}_{\text{elcx}, j} f_p \left\{ (1 + \tilde{n}_j^\phi) \left( \frac{n_0^\phi}{n_{\theta j}} \left( \tilde{n}_j^\phi + \tilde{n}_j^\theta \right) \right) - \left( \tilde{n}_j^\phi + \tilde{n}_j^\theta \right) \right\} - \sum_{k \neq j} \tilde{V}_{\theta k} \left[ f_p \nu_{jk} \sqrt{\frac{n_j}{n_k}} \right] = -q \tilde{V}_{\phi j} - q e \tilde{V}_{\phi j} \varepsilon \Phi_j \left[ \hat{\Phi}^\phi + \tilde{n}_j^\phi \tilde{\Phi}^\phi \right] - q^2 f_j f_p \left( \tilde{V}_{\phi j} + \tilde{P}_j^\phi \right) \tilde{\Phi}^\phi \]  

(8)
\[
\begin{align*}
\tilde{n}_j^s & \left[ + \frac{1}{2} f_j f_p \bar{V}_{\theta j} + \frac{1}{2} \varepsilon f_p \sum_{k \neq j} \nu_{jk}^s \bar{V}_{\theta k} + \frac{1}{2} q \nu_{sionj} f_p \bar{V}_{\theta j} \right] \\
+ \tilde{n}_j^c & \left[ + \frac{1}{2} f_j f_p \bar{V}_{\theta j}^0 - \frac{1}{2} \varepsilon f_p \sum_{k \neq j} \nu_{jk}^c \bar{V}_{\theta k} + \frac{1}{2} q \nu_{ionj} \bar{V}_{\theta j}^0 \right] = - \frac{1}{2} \varepsilon f_p \sum_{k \neq j} \nu_{jk}^s \bar{V}_{\theta k} \tilde{n}_k^c \\
- \frac{1}{2} q \Phi_j \left[ - \tilde{\Phi}_j^s \right] - \frac{1}{2} \nu_{sionj} f_p \left[ \frac{1}{2} \left( \bar{V}_{\theta j} - \bar{V}_{\theta j}^0 \right) - \tilde{\Phi}_j^c - \frac{1}{2} q f_p \bar{V}_{\theta j} - \frac{1}{2} q \bar{V}_{\theta j}^2 \right] \\
- \frac{1}{2} q \nu_{sionj} \left[ f_p \bar{V}_{\theta j} \tilde{n}_{sionj}^c + \nu_{ionj} \tilde{n}_{sionj}^c \right] - q \nu_{ionj} f_p \left[ \frac{1}{2} \bar{V}_{\theta j} \left\{ \tilde{n}_{sionj}^c \left( 1 + \frac{n_0^0}{n_0^s} \right) + \frac{n_0^0}{n_0^s} \tilde{n}_j^c \right\} \right] \\
+ \frac{1}{2} q f_j \frac{n_0^0}{n_0^s} \left( \tilde{n}_j^c + \tilde{n}_{sionj}^c \right)
\end{align*}
\]

and

\[
\begin{align*}
\tilde{n}_j^s & \left[ + \frac{1}{2} f_j f_p \bar{V}_{\theta j} + \frac{1}{2} \varepsilon f_p \sum_{k \neq j} \nu_{jk}^s \bar{V}_{\theta k} + \frac{1}{2} q \nu_{sionj} f_p \bar{V}_{\theta j} \right] \\
+ \tilde{n}_j^c & \left[ - \frac{1}{2} q f_p \bar{V}_{\theta j}^2 + \frac{1}{2} \varepsilon f_p \sum_{k \neq j} \nu_{jk}^c \bar{V}_{\theta k} + \frac{1}{2} q \nu_{ionj} \bar{V}_{\theta j}^0 \right] = - \sum \tilde{n}_k^c \left[ - \frac{1}{2} (1 + \bar{\Phi}_j^c) \bar{V}_{\theta j} - \left( \tilde{\Phi}_j^c - \tilde{\Phi}_j^c \right) \left( \bar{V}_{\theta j} - \bar{V}_{\theta j}^0 \right) \right] \\
- \frac{1}{2} q \nu_{sionj} \left[ f_p \tilde{n}_{sionj}^c - \nu_{ionj} \tilde{n}_{sionj}^c \right] - \frac{1}{2} q \nu_{sionj} \left[ f_p \bar{V}_{\theta j} \tilde{n}_{sionj}^c + \nu_{ionj} \tilde{n}_{sionj}^c \right] \\
- \frac{1}{2} q \nu_{ionj} \left[ \frac{1}{2} \bar{V}_{\theta j} \left\{ 1 + \frac{n_0^0}{n_0^s} \right\} + \frac{n_0^0}{n_0^s} \tilde{n}_j^c + \frac{1}{2} q f_j \frac{n_0^0}{n_0^s} \left( \tilde{n}_j^c + \tilde{n}_{sionj}^c \right) \right]
\end{align*}
\]

where the “e” and “o” subscripts refer to electrons and neutrals, respectively, and

\[
\begin{align*}
\bar{V}_{\theta j} & = \frac{V_{\theta j}}{v_{thj}}, \quad \bar{V}_{\theta j}^0 & = \frac{V_{\theta j}^0}{v_{thj}}, \quad \bar{V}_{\theta j} = \left( \frac{m_{e/o} v_{thj}}{m_{e/o}} \right) f_p \left( \frac{v_{thj}}{v_{thj}} \right), \quad \tilde{\Phi}_j \equiv \frac{c_j \Phi_j}{T_j}, \\
\tilde{\Phi}_j & = \frac{1}{2 \beta_{\theta j} v_{thj}^2} \frac{\partial \rho_j}{\partial r}, \quad \tilde{\rho}_j^{c/o} \equiv \frac{\rho_j^{c/o}}{v_{thj}^2}, \quad \tilde{\Phi}_j^{c/o} \equiv \frac{\Phi_j^{c/o}}{\varepsilon} = \frac{\rho_j^{c/o}}{\varepsilon} \left( \frac{\rho_j}{\varepsilon \Phi_j^0 / T_j} \right), \\
\bar{V}_{\theta j}^{s/o} & = \frac{V_{\theta j}^{s/o}}{v_{thj}^{s/o}} = - \left( V_{\theta j}^{s/o} / V_{\theta j}^0 \right) f_p^{-1} \left( \tilde{n}_j^c + \tilde{\Phi}_j^c \right) + \tilde{\Phi}_j^c \left( 1 + \tilde{\Phi}_j^c / V_{\theta j}^0 \right), \\
\bar{V}_{\theta j}^{c/o} & = \frac{V_{\theta j}^{c/o}}{v_{thj}^{c/o}} = 1 - \left( V_{\theta j}^{c/o} / V_{\theta j}^0 \right) f_p^{-1} \left( 2 + \tilde{n}_j^c + \tilde{\Phi}_j^c \right) + \tilde{\Phi}_j^c \left( 1 + \tilde{\Phi}_j^c / V_{\theta j}^0 \right), \\
\nu_{jk}^{c/o} & = \frac{\nu_{jk}^{c/o}}{v_{thj}^{c/o} / q R_j}, \quad \nu_{sionj}^{c/o} \equiv \left( \frac{\nu_{sionj} + \nu_{sionj,nb}}{v_{thj}^{c/o}} \right) r, \quad \nu_{sionj}^{c/o} \equiv \left( \nu_{sionj}^{c/o} + \nu_{sionj,nb}^{c/o} \right) r / v_{thj}^{c/o}, \quad \nu_{ionj}^{c/o} \equiv \left( \nu_{ionj}^{c/o} + \nu_{ionj,nb}^{c/o} \right) r / v_{thj}^{c/o}
\end{align*}
\]

The corresponding Fourier components of the poloidal velocity are given by

\[
\begin{align*}
\bar{V}_{\theta j}^{s/o} & = V_{\theta j}^{s/o} = \left( r v_{ion} / V_{\theta j}^0 \right) \left( \tilde{n}_j^c + \tilde{n}_{sionj}^c \right) - \tilde{n}_j^c, \\
\bar{V}_{\theta j}^{c/o} & = V_{\theta j}^{c/o} = - \left( r v_{ion} / V_{\theta j}^0 \right) \left( \tilde{n}_j^c + \tilde{n}_{sionj}^c \right) - \left( 1 + \tilde{n}_j^c \right)
\end{align*}
\]
4 Toroidal viscous force

The toroidal viscous force (actually torque) can be written in toroidal flux surface coordinates [3]

\[ R^2 \nabla \phi \cdot \nabla \cdot \Pi = \frac{1}{R h_p} \frac{\partial}{\partial \varphi} \left( R^2 h_p \Pi_{\varphi \varphi} \right) + B_r \frac{\partial}{\partial r} \left( \frac{R \Pi_{r \varphi}}{B_p} \right) \]  \hspace{1cm} (13)

where the \( \Pi_{\varphi \varphi} \) are the stress tensor elements. In this Braginskii decomposition [4] of the rate-of-strain tensor in a flux-surface coordinate system, the neoclassical viscous stress tensors have ‘perpendicular’ components with coefficients \( \eta_2 \) that are well known to be too small to account for the observed radial momentum transport rate, gyroviscous components

\[ \Pi_{\varphi \varphi}^v = -\eta_4 R \frac{\partial}{\partial \varphi} \left( \frac{V_\varphi}{R} \right), \quad \Pi_{r \varphi}^v = -\eta_4 R \frac{\partial}{\partial \varphi} \left( \frac{V_r}{R} \right) \]  \hspace{1cm} (14)

and ‘parallel’ viscous components

\[ \Pi_{\varphi \varphi}^p = 0, \quad \Pi_{r \varphi}^p = -\frac{3}{2} \eta_0 f_p A_0 \]  \hspace{1cm} (15)

The Braginskii values [4] of the viscosity coefficients for a collisional plasma are

\[ \eta_0 \simeq nT \tau f_{ne0} \gg \eta_4 \simeq nTm/Z e B = \eta_0 f_{ne0}^{-1} / \Omega \tau \gg \eta_2 \simeq \eta_4 / \Omega \tau \simeq \eta_0 f_{ne0}^{-1} / (\Omega \tau)^2 \]  \hspace{1cm} (16)

where \( \tau \) is the self-collision frequency and \( \Omega = m/Z e B \) is the gyrofrequency. Since typically \( \Omega \tau \approx 10^{-3} \ldots 10^{-4}, \eta_0 f_{ne0} \gg \eta_4 \gg \eta_2 \). Taking into account lower collisionality should not effect \( \eta_4 \), which has no \( \tau \)-dependence, and has been shown [5, 6] to have very little effect on \( \eta_2 \). However, collisionality has a major effect on \( \eta_0 \), which we represent as indicated in Eq. (7) and as \( f_{ne0} \) above. It has also been shown [7-9] that it may be necessary to extend the viscous torque to include heat flux terms in steep gradient regions with small rotation velocities, such as are found in the plasma edge.

5 Toroidal Rotation

Equations for the toroidal rotation can be derived from the toroidal component of the angular momentum balance equation and the particle balance equation for species “j”

\[ R^2 \nabla \phi \cdot n_j m_j (V_j \cdot \nabla) V_j + R^2 \nabla \phi \cdot \nabla \cdot \Pi_j = n_j e_j \tau \left( E_{\varphi j} + V_j B_\theta \right) - \]

\[ R n_j m_j (V_{\phi j} - V_{\theta j}) + R M_{\phi j} \right) = R n_j \left( n_j \nu_{at,j} \right) V_{\phi j} \]  \hspace{1cm} (17)

where the toroidal component of the inertial term is

\[ R^2 \nabla \phi \cdot n_j m_j (V_j \cdot \nabla) V_j = R n_j m_j \left( \frac{V_{\phi j}}{R} \frac{\partial V_{\phi j}}{\partial \theta} + \frac{V_j V_{\phi j}}{R} \cos \theta + \frac{V_{\phi j} V_{\phi j}}{R} \sin \theta \right) \]  \hspace{1cm} (18)

5.1 Gradient Scale Length Formulation

If we can obtain gradient scale lengths (e.g. from experiment), then the flux surface averages of Eq. (17) for all can be written as a coupled set of algebraic equations at each radial point

\[ n_j^0 m_j \nu_{jk}^0 \left( (1 + \beta_j) V_{\phi j}^0 - V_{\theta j}^0 \right) = n_j^0 e_j E_{\phi j} \right) + \epsilon_j B_\theta \right) \right) + M_{\phi j}^0 \equiv n_j^0 m_j \nu_{jk}^0 \right) \]  \hspace{1cm} (19)

where \( M_{\phi j} \) is the momentum input from the neutral beams, \( M_{\phi j}^{nb} \), and possibly from other “anomalous” mechanisms, \( M_{\phi j}^{anom} \), and the radial transfer of toroidal momentum by viscous, inertial, and atomic physics and perhaps “anomalous” is represented by the parameter

\[ \beta_j \equiv \frac{\nu_{jk}^0}{\nu_{jk}^\alpha} + \frac{\nu_{jk}^0 + \nu_{jk}^\alpha + \nu_{jk}^\alpha + \nu_{\phi j}^\alpha + \nu_{\phi j}^\alpha}{\nu_{jk}^\alpha} + \nu_{\phi j}^\alpha \right) \]  \hspace{1cm} (20)
where \( \nu_{m,j} \) is the frequency for the radial transport of toroidal angular momentum due to inertial effects, \( \nu_{atom,j}^{0} \) is the frequency for loss of toroidal momentum due to atomic physics processes \( \nu_{atom,j} \) is the frequency for loss of toroidal momentum by “anomalous” processes (e.g. turbulent transport, ripple viscosity).

The gyroviscous momentum transport frequency is defined by

\[
\langle R^2 \nabla \phi \cdot \nabla \cdot \pi_j \rangle_{g0} \simeq \frac{1}{2} \tilde{\theta}_j G_j \frac{n_j m_j T_j}{e_j B} V_{\phi j}^{0} = R n_j m_j \nu_{\phi j} V_{\phi j}^{0}
\]

where

\[
\tilde{\theta}_j \equiv (4 + \tilde{n}_j^c) \tilde{V}_{\phi j}^{c} + \tilde{n}_j^r \left( 1 - \tilde{V}_{\phi j}^{c} \right)
\]

represents poloidal asymmetries and

\[
G_j \equiv -\frac{r}{\eta_j V_{\phi j}} \frac{\partial (\eta_j V_{\phi j})}{\partial r} = r \left( L_n^{-1} + L_T^{-1} + L_{\nu}^{-1} \right)
\]

represent radial gradients. We have used the gyroviscosity coefficient \( \eta_j \approx n_j m_j T_j/e_j B \).

The inertial momentum transport frequency is defined by

\[
\langle R^2 \nabla \phi \cdot \nabla \cdot \mathbf{V}_j \rangle \simeq \frac{1}{2} \frac{V_{\phi j}}{R_o} \left\{ \varepsilon \left( 1 + \tilde{n}_j^c + \tilde{V}_{\phi j}^{c} \right) - 2 R_o L_{\nu_{\phi j}}^{-1} \right\} - \varepsilon \frac{V_{\phi j}}{R_o} \left( \tilde{V}_{\phi j}^{c} \left( 1 + \tilde{V}_{\phi j}^{c} \right) - \tilde{V}_{\phi j}^{c} \tilde{n}_j^r \right) n_j m_j R V_{\phi j}^{0} \equiv R n_j m_j \nu_{\phi j} V_{\phi j}^{0}
\]

The last term vanishes in the absence of ionization sources.

### 5.2 Differential Equation Formulation

If the radial gradient scale lengths in the \( \nu_{\phi j} \) and \( \nu_{n,j} \) (in \( \beta_j \)) in Eqs. (19) are replaced by their definitions

\[
L_{\nu}^{-1} \equiv -\frac{1}{v \langle dx/dr \rangle}
\]

then these equations become coupled first order ODEs that must be solved for the \( V_{\phi j}^{0} \), together with similar equations for the density and temperature [1].

Alternatively, it is possible to solve explicitly for the poloidal dependence of the toroidal rotation velocity by expanding the poloidal dependence of the toroidal rotation frequency

\[
\Omega_{\phi j} (r, \theta) \equiv \frac{V_{\phi j}}{R} = \Omega_{\phi j}^{0} (r) + \Omega_{\phi j}^{s} (r) \sin \theta + \Omega_{\phi j}^{E} (r) \cos \theta
\]

using similar density and poloidal velocity expansions, and flux surface averaging with weighting functions of 1, \( \sin \theta \) and \( \cos \theta \) then leads to three equations for each ion species "\( j \)"

\[
\frac{d\Omega_{\phi j}^{0}}{dr} \left[ R_{\phi j} V_{r j} \right] + \frac{d\Omega_{\phi j}^{s}}{dr} \left[ \frac{n_j m_j}{2 n_j m_j} \right] - \frac{d\Omega_{\phi j}^{E}}{dr} \left[ \frac{n_j (\tilde{n}_j^c + 3)}{2 n_j m_j} \right] + \Omega_{\phi j}^{0} \left[ V_{r j} \varepsilon \left( 2 + \tilde{n}_j^c \right) + R_{\phi j} \left( \tilde{V}_{\phi j}^{c} + \tilde{V}_{\phi j}^{s} \right) \right] - \Omega_{\phi j}^{E} \left[ \frac{n_j m_j}{\tilde{n}_j m_j} \left( \tilde{n}_j^c \left( L_{\nu_{\phi j}}^{-1} + L_{T_{\phi j}}^{-1} \right) \tilde{n}_j^c + 3 \right) - \varepsilon \frac{dn_j^s}{dn_j} \right] + \right] + \Omega_{\phi j}^{s} \left[ \frac{n_j m_j}{\tilde{n}_j m_j} \left( \left( L_{\nu_{\phi j}}^{-1} + L_{T_{\phi j}}^{-1} \right) \tilde{n}_j^c + 3 \right) - \varepsilon \frac{dn_j^s}{dn_j} \right] + \right] + \Omega_{\phi j}^{E} \left[ \frac{n_j m_j}{\tilde{n}_j m_j} \left( \tilde{V}_{\phi j}^{c} \tilde{n}_j^c + 3 \right) - \varepsilon \frac{dn_j^s}{dn_j} \right] + \right] + \right] + \right] + \right] + \right]

\[
\Omega_{\phi j}^{0} \left[ \frac{n_j m_j}{\tilde{n}_j m_j} \left( \tilde{V}_{\phi j}^{c} \tilde{n}_j^c + 3 \right) - \varepsilon \frac{dn_j^s}{dn_j} \right] + \right] + \right] + \right] + \right]

\[
= \frac{c_j}{m_j} \left[ E_{\phi}^A + V_{r j} B_{\phi}^0 \right] + \frac{M_{\phi j}}{n_j m_j}
\]

\[
\varepsilon = \frac{c_j}{m_j} \left[ E_{\phi}^A + V_{r j} B_{\phi}^0 \right] + \frac{M_{\phi j}}{n_j m_j}
\]

\[
\varepsilon = \frac{c_j}{m_j} \left[ E_{\phi}^A + V_{r j} B_{\phi}^0 \right] + \frac{M_{\phi j}}{n_j m_j}
\]
The above formalism, with the gradient scale-length formulation of section 5.1, was applied to calculate rotation \( V_\theta \) and \( E_r \) in a few DIII-D shots. Density and temperature profiles and gradient scale lengths were taken from experiment, and the total momentum transfer frequency \( \nu_{\phi j} \) was inferred from experiment by matching the \( V_{\phi j} \) calculated from Eq. (18) to experiment, and then compared with the calculated gyroviscous and atomic transfer frequencies, as shown in Fig. 1 for LSN shot with continuous gas fueling. Neoclassical gyroviscosity and atomic momentum transfer frequencies in DIII-D.

\[
\frac{dV_\theta}{dt} = \left[ \frac{\eta_{\theta j} \tilde{n}_j}{n_j^{s,c}} + rV_{r j} \left( \tilde{n}_j^{c} + 3 \right) \right] + \frac{dV_{\phi j}}{dt} \left[ R_\theta V_{r j} \right] + \O_\phi \left[ 2V_{r j} + r \tilde{\tau}_{jk} \left( 2 + \tilde{n}_j^{c} + \tilde{n}_k^{c} \right) + r \tilde{\tau}_{at,j} \left( 2 + \tilde{n}_j^{c} + \tilde{n}_j^{s,c} \right) + \frac{\nu_{\theta j} \tilde{n}_j^{s,c} + \tilde{n}_j^{c}}{n_j^{s,c}} \right] + \O_\phi \left[ R_\theta \left( \tilde{\tau}_{jk} + \tilde{\tau}_{at,j} \right) + \frac{R_{\phi k} E_r}{n_j^{s,c}} \right] + \O_\phi \left[ R_\theta \left( \tilde{\tau}_{jk} + \tilde{\tau}_{at,j} \right) + \frac{R_{\phi k} E_r}{n_j^{s,c}} \right] + \O_\phi \left[ \frac{\eta_{\theta j} \tilde{n}_j^{s,c} + \tilde{n}_j^{c}}{n_j^{s,c}} \right]
\]

where \( \tilde{S}_{j}^{s,c} \equiv \{ (+, -) \nu_{\text{on}} (n_j^{s,c} + n_j^{c,s}) \}. \) The radial velocity \( V_{r j} = V_{r j}^{\text{class}} + V_{r j}^{\text{anom}} \), where the classical term can be calculated from particle, momentum and energy balance [1] and any anomalous momentum transport is assumed to be convective.

### 6 Application to DIII-D

The above formalism, with the gradient scale-length formulation of section 5.1, was applied to calculate rotation \( V_\theta \) and \( E_r \) in a few DIII-D shots. Density and temperature profiles and gradient scale lengths were taken from experiment, and the total momentum transfer frequency \( \nu_{\phi j} \) was inferred from experiment by matching the \( V_{\phi j} \) calculated from Eq. (18) to experiment, and then compared with the calculated gyroviscous and atomic transfer frequencies, as shown in Fig. 1 for LSN shot with continuous gas fueling. Neoclassical gyroviscosity and atomic momentum transfer frequencies in DIII-D.

![Fig. 1](image1.png) Experimentally inferred and calculated angular momentum transfer frequencies in DIII-D.

![Fig. 2](image2.png) Measured and calculated poloidal rotation velocities in DIII-D.
